Homework 2

September 27, 2021

Jose Carlos Munoz

3.2c)

$$Gini_{Male} = 1 - (\frac{4}{10})^2 - (\frac{6}{10})^2$$

$$= 0.48$$
(1)

$$Gini_{Female} = 1 - (\frac{4}{10})^2 - (\frac{6}{10})^2$$

= 0.48

$$Gini_{Gender} = \frac{10}{20} * Gini_{Male} + \frac{10}{20} * Gini_{Female}$$

$$= 0.48$$
(3)

The Gini for Male is as showin in(1)

The Gini for Female is as showin in(2)

The Gini for gender is as showin in(3)

3.2d)

$$Gini_{Family} = 1 - (\frac{1}{4})^2 - (\frac{3}{4})^2$$

$$= 0.375$$
(1)

$$Gini_{Sports} = 1 - (\frac{8}{8})^2 - (\frac{0}{8})^2$$

$$= 0.00$$
(2)

$$Gini_{Luxury} = 1 - (\frac{1}{8})^2 - (\frac{7}{8})^2$$

$$= 0.21875$$
(3)

$$Gini_{Cars} = \frac{4}{20} * Gini_{Family} + \frac{8}{20} * Gini_{Sports} + \frac{8}{20} * Gini_{Luxury}$$

$$= 0.1625$$
(4)

The Gini for Family is as showin in(2)

The Gini for Sports is as showin in(3)

The Gini for Luxury is as showin in(4)

The Gini for Cars is as showin in(??)

3.2e)

$$Gini_{Small} = 1 - (\frac{2}{5})^2 - (\frac{3}{5})^2$$

= .48

$$Gini_{Medium} = 1 - (\frac{3}{7})^2 - (\frac{4}{7})^2$$

$$= \frac{24}{49}$$
(2)

$$Gini_{Large} = 1 - (\frac{3}{4})^2 - (\frac{1}{4})^2$$

$$= 0.5$$
(3)

$$Gini_{Extra_{L}arge} = 1 - (\frac{2}{4})^2 - (\frac{2}{4})^2$$

$$= 0.5$$
(4)

$$Gini_{Shirt_Size} = \frac{5}{20} * Gini_{Small} + \frac{7}{20} * Gini_{Medium} + \frac{4}{20} * Gini_{Large} + \frac{4}{20} * Gini_{Extra_{Large}}$$

$$= 0.4914$$

$$(5)$$

The Gini for Small is as showin in(1)

The Gini for Medium is as showin in(2)

The Gini for Large is as showin in(3)

The Gini for Extra Large is as showin in(4)

The Gini for Shirt Size is as showin in(5)

3.2f)

The Car type because it has the lowest Gini Index.

3.5a)

$$E_{orig} = -\frac{4}{10} * log(\frac{4}{10}) - \frac{6}{10} * log(\frac{6}{10})$$

$$= .9710$$
(1)

The overall Entropy before the split is shown in (1)

$$E_{T} = -\frac{4}{7} * log(\frac{4}{7}) - \frac{3}{7} * log(\frac{4}{7})$$

$$E_{F} = -\frac{3}{3} * log(\frac{3}{3}) - \frac{0}{3} * log(\frac{0}{0})$$

$$\Delta E = Eorig - \frac{7}{10} * E_{T} - \frac{3}{10} * E_{F}$$

$$= 0.2813$$
(2)

The data gain from the splitting for A is show in (2)

$$E_{T} = -\frac{3}{4} * log(\frac{3}{4}) - \frac{1}{4} * log(\frac{1}{4})$$

$$E_{F} = -\frac{1}{6} * log(\frac{1}{6}) - \frac{5}{6} * log(\frac{5}{6})$$

$$\Delta E = Eorig - \frac{4}{10} * E_{T} - \frac{6}{10} * E_{F}$$

$$= 0.2565$$
(3)

The data gain from the splitting for B is show in (3)

3.7a)

To find best greedy split we find which of the options gives us the least errors

$$\begin{bmatrix} X & C1 & C2 \\ 0 & 60 & 60 \\ 1 & 40 & 40 \end{bmatrix} \tag{1}$$

As seen from (1), when X is 0, we see that there is a min of 60 errors and when X is 1, there is a min of 40 errors. So for X, it has an error rate of frac60 + 40200;.5

$$\begin{bmatrix} Y & C1 & C2 \\ 0 & 40 & 60 \\ 1 & 60 & 40 \end{bmatrix} \tag{2}$$

As seen from (2), when Y is 0, we see that there is a min of 40 errors and when X is 1, there is a min of 40 errors. So for X, it has an error rate of frac40 + 40200; 4

$$\begin{bmatrix} Z & C1 & C2 \\ 0 & 30 & 70 \\ 1 & 70 & 30 \end{bmatrix} \tag{3}$$

As seen from (3), when Z is 0, we see that there is a min of 30 errors and when X is 1, there is a min of 30 errors. So for X, it has an error rate of frac30 + 30200; .3 We split first at Z because it has the lowest error rate

Z=0

$$\begin{bmatrix} X & C1 & C2 \\ 0 & 15 & 45 \\ 1 & 15 & 25 \end{bmatrix} \tag{1}$$

As seen from (1), when X is 0, we see that there is a min of 15 errors and when X is 1, there is a min of 15 errors. So for X, it has an error rate of frac15 + 15100; 3

$$\begin{bmatrix} Y & C1 & C2 \\ 0 & 15 & 45 \\ 1 & 15 & 25 \end{bmatrix} \tag{2}$$

As seen from (1), when Y is 0, we see that there is a min of 15 errors and when X is 1, there is a min of 15 errors. So for X, it has an error rate of frac15 + 15100; 3 Since both are about the same, the node split can be choosen arbitrarly

Z=1

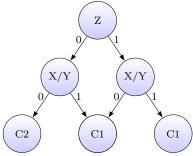

$$\begin{bmatrix} X & C1 & C2 \\ 0 & 25 & 15 \\ 1 & 25 & 15 \end{bmatrix} \tag{1}$$

As seen from (1), when X is 0, we see that there is a min of 15 errors and when X is 1, there is a min of 15 errors. So for X, it has an error rate of frac15 + 15100; 3

$$\begin{bmatrix} Y & C1 & C2 \\ 0 & 45 & 15 \\ 1 & 45 & 15 \end{bmatrix} \tag{2}$$

As seen from (2), when Y is 0, we see that there is a min of 15 errors and when X is 1, there is a min of 15 errors. So for X, it has an error rate of frac15 + 15100; 3 Since both are about the same, the node split can be choosen arbitrarly

The 2 level decision tree looks like this

This Decision tree has an error of frac15 + 15 + 15 + 15200, 0.3 3.7b)

If we start with X instead of Z then this is how it would played out X=0

$$\begin{bmatrix} Y & C1 & C2 \\ 0 & 5 & 55 \\ 1 & 55 & 55 \end{bmatrix} \tag{1}$$

As seen from (1), when Y is 0, we see that there is a min of 5 errors and when Y is 1, there is a min of 5 errors. So for Y, it has an error rate of frac5 + 5100; 1

$$\begin{bmatrix} Z & C1 & C2 \\ 0 & 15 & 45 \\ 1 & 45 & 15 \end{bmatrix} \tag{2}$$

As seen from (2), when Z is 0, we see that there is a min of 15 errors and when Z is 1, there is a min of 15 errors. So for X, it has an error rate of frac15 + 15100; .3Since Y is has the lowest error rate, we split at Y

X=1

$$\begin{bmatrix} Y & C1 & C2 \\ 0 & 35 & 5 \\ 1 & 5 & 35 \end{bmatrix} \tag{1}$$

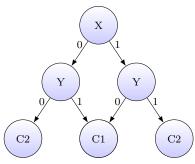

As seen from (1), when Y is 0, we see that there is a min of 5 errors and when Y is 1, there is a min of 5 errors. So for X, it has an error rate of frac5 + 5100; 1

$$\begin{bmatrix} Z & C1 & C2 \\ 0 & 15 & 25 \\ 1 & 25 & 15 \end{bmatrix} \tag{2}$$

As seen from (2), when Z is 0, we see that there is a min of 15 errors and when Z is 1, there is a min of 15 errors. So for X, it has an error rate of frac15 + 15100; 3

Since Y has the lowest rate of error, we split at Y

The 2 level decision tree will now looks like this

This Decision tree has an error of frac5 + 5 + 5 + 5200, 0.1 3.7c)

We see that the decision tree for answer 3.7b has a lower error rate. This demonstrates that a greedy split is not always hueristic

3.8a)

answer 1

3.8b)

answer 1 3.8c)
